

FocalPoint™

Critical, real-time, web based operations reporting designed for data capture and management solutions. Don't let your current reports limit you any longer!

Real-time, cross-platform capable, web based operations reporting designed for data capture and information management solutions. Don't let your current reports limit you any longer!

PaperFree Corporation's FocalPoint™ is an easy-to-use, web based reporting tool that provides the detailed data needed to maximize both operational efficiency and overall cost saving goals for data capture and management systems. FocalPoint™ is designed to integrate seamlessly with most any standard data capture or information management products including (but not limited to) EMC's InputAccel, Dispatcher, FormWare, and ClaimPack solutions. Add value to any data capture system with critical, real-time operations reports from PaperFree Corporation, the trusted leader in information capture and management solutions.

FocalPoint™ pulls data from capture or information management workflows without impacting performance. Data is aggregated in a separate back-end database for further processing and analysis. An intranet installed website displays the data in a series of web reports using state of the art dynamic, interactive web presentation technology. Built-in reports expose data including workflow tracking, operator productivity, OCR performance, work bottlenecks, system monitoring, and volume forecasts. Custom reports are easily created and made available using a wizard driven process. Pull data from multiple sources or systems and use a single reporting solution for all your reporting needs.

Improve Workforce Performance

- Compare the speed and accuracy of data entry operations day over day and operator to operator in order to get the best output from each operator.
- Set data-entry standards and monitor operator performance for improved metrics and clear efficiency gains.
- Auto-notify management with real-time alerts when standards are not met (requires Clarity monitoring software).

Identify Bottlenecks

- View reports that track the speed at which work flows through each process of your workflow, allowing the easy identification of bottlenecks.
- See how much work is present in any process of your data capture system and filter the work by type of job, batch, or document.

Monitor and Forecast

- Use the actual historical data of your system to forecast staffing and the total time needed to complete future work.
- Report on documents completed by day, week, month, or any time period through the use of built in filters.
- OCR accuracy reports at the batch, document, or field level for monitoring and tuning of OCR results.
- Pull all your data into a single report view from several external sources such as Smead, InfoPointe, and other third party systems and reporting packages.

Filter, Save, Export

- Use prebuilt filters to narrow down the data in each report.
- Save sets of filters as a custom report to easily reload filter settings for any report.
- Export table information as Microsoft Excel readable .csv files.
- Export data to PDF format.

Built-In Reports

- Aging Report
- Workflow Summary
- Workflow Detail
- OCR Accuracy
- Exception
- Operator Performance
- Operator Productivity
- Work History
- Work Speed
- Work Volume
- Work Plan
